Question What is the general form of a linear equation in two variables? The general form is $ax + by + c = 0$, where a , b , and c are constants, and x and y are variables. How can you determine if two lines are parallel using their equations? Two lines are parallel if their slopes are equal but their y -intercepts are different. In equations form, if both lines are in slope-intercept form $y = mx + b$, they are parallel if they share the same m but have different b . What is the method to solve a system of linear equations using substitution? Solve one of the equations for one variable, then substitute that expression into the other equation. Solve for the remaining variable and back-substitute to find the other variable. How do you identify the solution to a multiple-choice question involving linear equations? You substitute each option into the given equations to check which one satisfies all equations simultaneously. What does it mean if a system of linear equations has no solution? It means the lines are parallel and do not intersect, indicating inconsistent equations with no common point. How can graphing help in solving multiple-choice questions on linear equations? Graphing the equations helps visualize the solutions; the point(s) of intersection represent solutions, aiding in selecting the correct multiple-choice answer. Why is understanding the

slope-intercept form important for solving multiple-choice linear equations questions? Because it makes it easier to identify the slope and y-intercept directly, which is useful for quickly determining solutions and analyzing relationships between lines.
